Snoop is a little-known WPF tool that has the role of spying and debugging any running WPF application. Snoop is a very useful tool for developers of any level of experience. You can use Snoop to debug your WPF applications and take screenshots of them as well. However, Snoop isn't completely focused on development and you can also use Snoop for windows management, for example, you can use Snoop for the purpose of the Automation Testing, for the add-ins development, to Remote Control of apps and for general UI testing. All in all, Snoop is a handy tool for WPF developers. This article shows how to use the Visual Studio Extension Snoop to debug and screenshot a running application. The focus is directed at the Windows Presentation Foundation (WPF) technology. Although Microsoft started to abandon Windows Presentation Foundation (WPF) with.NET 4, you can still use it. What's New In Snoop?

Snoop is an open-source program for snooping over and debugging running Windows Presentation Foundation (WPF) applications. The app also works with Silverlight applications and some third party programmers point out that the tool can work with Firefox. Key Features: Snoop is a lightweight tool. The app is a small bar with a cross-hairs, which you can drag around the screen to spy on the WPF app. Then you should move the mouse and the results of data collection will appear as a WPF app tree. To proceed, you can get a list of properties or view them inside the WPF app editor. The Snoop UI is focused on simplicity and doesn't work with complex things. However, it enables you to view all the WPF properties, inspect the elements' layout, get data from them and use them for resizing or modifying the properties. Another thing that separates Snoop from other tools is the fact that you don't need to install a special plugin for snooping the WPF app. It can be used with the latest versions of Internet Explorer and Google Chrome as well. Since Snoop is a free program that's distributed under the GPL v. 2.0, you can take it with you when you decide to redistribute the WPF app along with it. However, many users report that the app is "not very useful" because "you do need lots of hand-coding". The program cannot modify the WPF window, so you shouldn't expect Snoop to overhaul the layout of a program. However, the developer may work with the tree/properties menu or with the quick search. The Snoop tutorial page shows that one can use the app with third party programs as well, so you can easily spy over your Silverlight and XAML application. The developer can even add his own list of properties to the menu and limit the scope of results. For instance, there could be a list of "Internal controls", "Forms", "Controls" and "View". But regardless of whether you use Snoop with WPF or other applications, all the users say that the tool is a useful tool that helps you view the properties of the targeted element.
